Data savings
through offline sync

4.7

Trust score
out of 5 in follow-up interviews

PROCESS

What we learned.

01

Trust is the interface.

Before any feature, users needed to understand who built the app, where their data went, and why they should believe the advice. We added transparent sourcing, local partner branding, and a privacy promise in plain language.

02

Bandwidth is a design material.

We treated every image, font, and API call as a cost. The final app ships under 5 MB, queues actions offline, and degrades gracefully on 2G without breaking the core experience.

03

Literacy is a spectrum.

Even literate users prefer visuals when they are anxious or in a hurry. We reinforced every label with an icon and offered audio playback for every critical instruction.

04

Community scales care.

Individual users rarely manage health alone. Shared care plans and delegated reminders turned family members and local health workers into a support network.

EMERGING MARKETS UX

Health access for the next billion.

Pulse is a mobile health companion designed for low-bandwidth, low-literacy contexts — where trust, clarity, and offline resilience matter more than features.

Mobile app	Role	Timeline
Android-first	Product design	12 weeks

THE PROBLEM

Healthcare information is abundant, but it rarely reaches the people who need it most.

In emerging markets, users face unreliable networks, expensive data, crowded home screens, and complex medical language. Existing health apps are built for stable, literate, high-trust contexts — leaving hundreds of millions without a usable entry point to care.
